Subject: NCI Bid Board Posting – Z-Movi Contact Research National Cancer Institute Project 1 and 2

The Surgery Branch of the National Cancer Institute is a combined laboratory and clinical research unit devoted to the development of innovative cancer immunotherapies and their translation to the treatment of patients with cancer. Efforts run the gamut from basic studies of cancer immunology to the conduct of clinical immunotherapy trials for patients with metastatic cancer. The Surgery Branch was responsible for the development of interleukin-2 (IL-2), the first effective immunotherapy in humans, the development of cell transfer immunotherapies for melanoma and other solid cancers, the first insertion of foreign genes into humans and the first development of effective human cancer immunotherapies based on the genetic engineering of autologous lymphocytes with genes encoding anti-tumor T cell receptors or chimeric antigen receptors.

The primary objective of the Surgery Branch of the National Cancer Institute is to study the T cell biology to develop the best immunotherapy for patients with advanced cancers as these patients often suffer from resistance of their tumor to common standard chemotherapies. T cell engineering using a T cell receptor (TCR) is an attractive method to derive cancer-attacking host immune cells. When selecting a TCR to use clinically, many aspects of a TCR is considered. One important measurement is avidity, which is the binding strength of a given TCR against its targets (mostly cells). Accurately measuring TCR avidity as been hampered by the lack of reliable, consistent method as currently available methods are prone to many different errors, including variability between different measurements, human errors, or requirements such as recombinant human antigen leukocytes (HLA) proteins.

The Surgery Branch plans to purchase the z-Movi instrument from Lumicks, Inc. It has been developed to measure cell avidity, a key parameter for the development of immuno oncology therapies. z-Movi directly quantifies cell–cell binding strength at single-cell resolution by applying contactless acoustic forces. The binding avidity combines reproducibility and speed of biophysical methods with the predictiveness of a functional assay. This proposal contains all details regarding the research projects. However, if any interested party believes it can meet the attached requirements, it may submit a statement of capabilities. The capability statement must be in writing and must contain information and material in sufficient detail to allow NCI to determine is the party can fully meet this requirement. The capability statement must be received in the contracting office by 11:30 AM on May 14, 2022 ET. A determination by the Government not to compete this requirement based upon responses to this notice is solely within the discretion of the Government. Information received will be considered solely for the purpose of determining whether to conduct a competitive procurement.

Sole Source Justification:

The z-Movi® is the only instrument that directly measures the avidity between immune cells and their targets at a single cell level, therefore it will allow the determination of the most potent immunotherapeutic effector cells or best T cell receptor (TCR). This new technology provides you with predictive, reproducible, and fast high-throughput results at a single-cell resolution and there exist no other services or tools that are equivalent to the z-Movi® system. There are not any items and /or services offered by other solicited vendors and/or contractors in the marketplace, any organizations in the marketplace with the capability of providing the required items or services and (other than the suggested source) or any small businesses that can provide the required services that can satisfy the proposed requirement.

## 4.0 SPECIAL ORDER REQUIREMENTS

### 4.1 PRODUCT FEATURES/SALIENT CHARACTERISTICS

The z-Movi<sup>®</sup> is a unique instrument that measures the avidity between immune cells and their targets, enabling the determination of the most potent immunotherapeutic effector cells. This new technology provides predictive, reproducible, and fast high-throughput results at a single-cell resolution without compromising cell viability.

The following product features/characteristics are required for this requirement:

- **Direct measurement of binding avidity** - The z-Movi introduces the robustness of a biophysical-based method to immuno-oncology to uncover the essential properties of effector cells.
- **Single-cell resolution** - Measures the binding strength between every effector cell and its target to ensure that not a single piece of information is lost. Because each cell matters.
- **Safe to cells** - Offers non-invasive acoustics to measure avidity, leaving your cells healthy and viable.
- **Compact** - Small enough to fit inside a flow hood, providing sterile cell handling and protective conditions when working with dangerous reagents.
- **High throughput** - Analyzes avidities of up to 400 cells in a single run and generates instant statistically relevant data. The fast workflow enables you to measure multiple experimental conditions per day.
- **Fluorescence cell imaging** - Distinguishes and follows individual fluorescent effector cells with unparalleled accuracy as they detach from their target cells and gather at the acoustic node.
