Abstract

Communicating information, whether it is good or bad news, is an essential skill for oncologists. This module presents a six-step approach to structuring communication. The steps include getting started, finding out what the patient knows, finding out how much the patient wants to know, sharing information, responding to feelings, and planning/follow-up. Approaches for handling a family who says “don’t tell” the patient and for using a translator when language is a barrier are advocated.

Introduction

Communicating information, whether it is good or bad news, is an essential skill for oncologists. Many find it challenging to communicate effectively, especially when it involves a cancer from which the patient may eventually die. Some feel inadequately prepared or inexperienced. Others fear the news will be so distressing as to adversely affect the patient, family, therapeutic relationship, or course of the business day.

However, the vast majority of Americans want to know if they have a life-threatening illness. (Ref. 1) Studies in other cultures yield surprisingly similar data. (Ref. 2) (Ref. 3) Although legitimate cultural variations are important, communicating in a direct and compassionate manner improves the patient’s and family’s ability to plan and cope, encourages realistic goals and autonomy, supports the patient emotionally, strengthens the physician-patient relationship, and fosters collaboration among the patient, family, physicians, and other professionals.

Objectives

After studying this module, oncologists and other members of the cancer care team will be able to:

- Explain why the communication of information is a core clinical skill for oncologists.
- Use a six-step protocol to deliver bad news.
- Use a translator effectively when language is a barrier.
Six Steps for Communicating Effectively

The recommended six-step protocol has been adapted from How to Break Bad News: A Guide for Health Care Professionals by Robert Buckman. (Ref. 4) (Ref. 5) He and colleagues have subsequently developed a mnemonic, SPIKES, that helps physicians remember the protocol. (Ref. 6) Others have reported similar approaches. (Ref. 7) (Ref. 8)

</table>

During the first three steps, prepare to share the information. Start by gathering the facts. Then sit down comfortably and assess the patient’s understanding. Inquire what the patient knows and what he or she would like to know.

Some of these first three steps can be completed before the session at which you actually discuss the news.

During the last three steps, manage the information carefully. Deliver the news clearly, succinctly, and without using jargon. Once the facts have been stated, stop talking. Allow time for the patient’s reactions and respond to them. Once the patient is settled, plan for follow-up.

Don’t consider this protocol to be a script to be followed rigorously. Use it as a tool to guide important aspects of an interaction in which difficult information is shared.
Step 1: Set the stage

Before starting to communicate any news, plan what will be discussed. Confirm the medical facts of the case. Ensure that all needed information is available. If this is an unfamiliar task, rehearse what you will say. Don’t delegate the task. If several team members will be present, it may be helpful for the team to meet to plan the communication in advance.

Create an environment that is conducive to effective communication. Ensure privacy and adequate seating. Ensure that a box of facial tissues and a glass of water are handy.

Allot adequate time for the discussion. Do not slip this into a short interval between other critical tasks. Prevent interruptions. Arrange to hold telephone calls and pages or give them to someone else.

Determine who else the patient would like to have present for the discussion. This might include family, significant others, surrogate decision makers, and/or key members of the interdisciplinary team (e.g., nurse, social worker, chaplain, etc.).

Step 2: What does the patient know?

Start the discussion by establishing what the patient and family know about the patient’s health. With this information, ascertain whether the patient and family will be able to comprehend the information.

Questions might include:

- “What do you understand about your illness?”
- “How would you describe your medical situation?”
- “Have you been worried about your illness or symptoms?”
- “What did other doctors tell you about your condition or procedures that you have had?”
- “When you first had symptom X, what did you think it might be?”
- “What did Doctor X tell you when he sent you here?”
- “Did you think something serious was going on when…?”

Occasionally a patient will fall silent and seem completely unprepared or unable to respond. To ease the situation and stimulate discussion, try to clarify what the patient understands about his or her medical history and recent investigations. Identify absent family members or others on whom the patient relies. If this is ineffective and the patient remains silent, or if it appears the patient requires more support, it may be better to reschedule the meeting for another time.
Step 3: How much does the patient want to know?

Next, establish what and how much each patient wants to know.

People handle information differently, depending on their race, ethnicity and culture, religion, and socioeconomic class. Each person has the right to voluntarily decline to receive any information and may designate someone else to communicate on his or her behalf. Ask the patient and family how they would like to receive information. If the patient prefers not to receive critical information, establish who to give information to.

Possible questions include:

- “If this condition turns out to be something serious, do you want to know?”
- “Are you the kind of person who likes to know all the facts?”
- “Would you like me to tell you the full details of your condition? If not, is there somebody else you would like me to talk to?”
- “Some people really do not want to be told what is wrong with them, but would rather their families be told instead. What do you prefer?”
- “Do you want me to go over the test results now, and explain exactly what I think is wrong?”
- “Who would you like me to talk to about these issues?”

The way the patient answers the questions will give clues as to her or his educational level, verbal fluency, and family dynamics. Listen carefully and observe everyone’s responses to your questions. Use this experience to influence how you deliver your news.

Advance preparation

All of the discussion to this point is about preparation to give the diagnosis and prognosis. Some of that preparation might best occur well before the information is actually given. The initial assessment, and subsequent discussions that prepare the patient for critical tests, all provide opportunities to determine what the patient already knows and how he or she would like to have information handled.

Provide periodic information and caution that the news might not always be good. With this incremental approach and periodic “warning shots,” the patient and family may be better prepared for bad news.

When the family says “don’t tell”

Many times, family members will ask the physician not to tell the patient the diagnosis or other important information. While it is the physician’s legal obligation to obtain informed
consent from the patient, an effective therapeutic relationship requires a congenial alliance with the family.

Rather than confronting the request with, “I have to tell the patient,” inquire why they are concerned. Possible questions include:

- “Why don’t you want me to tell the patient?”
- “What is it that you are afraid I will say?”
- “Tell me about your past experience with cancer?”
- “Is there a personal, cultural, or religious context that you want me to know about?”

Suggest that you go to the patient together to ask how much he or she wants to know about his or her health and what questions there might be. Share anecdotes and talk about the pain of secrecy and the opportunities that come with open communication.

These situations may require significant negotiation. In particularly difficult cases, support from the institutional ethics committee may be helpful. Ultimately, it may be decided, after discussion with the patient, that details of diagnosis and prognosis and treatment decisions will be discussed only with the family. However, unless the patient has previously indicated that he or she wants no information, hiding the diagnosis or important information about prognosis or treatment from the patient is neither ethical nor legally acceptable.

Physicians do not need to feel constrained to practice in a way that compromises care or feels unethical. If the physician and the family cannot come to agreement, the physician may choose to withdraw from the case and transfer care to another physician.

There are ethnic and cultural differences in the preferred handling of information. While knowledge of such differences is useful as a background, global conclusions about them rarely help with decision making for an individual. The patient should be asked about general preferences for handling of medical information and decision making early in the clinical relationship before significant information needs to be shared. This will help the clinician avoid making a misstep.

**Step 4: Share the information**

Deliver the information in a sensitive but straightforward manner.

Start by letting the patient know that you have bad news, then share the facts. Say it, and then stop. Avoid delivering all of the information in a single, steady monologue. Use simple language that is easy to understand. Avoid technical jargon or euphemisms. Pause frequently. Check for understanding. Use silence and body language as tools to facilitate the discussion. (Ref. 9)
Do not minimize the severity of the situation. Well-intentioned efforts to “soften the blow” may lead to vagueness and confusion.

You might choose to break the bad news by using language like:

- “I feel badly to have to tell you this, but the growth turned out to be cancer.”
- “I’m afraid the news is not good. The biopsy showed that you have colon cancer.”
- “Unfortunately, there’s no question about the test results: it is cancer.”
- “The report is back, and it’s not as we had hoped. It showed that there is cancer in your colon.”
- “I’m afraid I have bad news. The bone marrow biopsy shows that you have leukemia.”

“I’m sorry”

The phrase “I’m sorry” may be interpreted by the patient or the family to imply that the physician is responsible for the situation. It may also be misinterpreted as pity or aloofness. If you use the phrase, adjust it to show empathy. For example, instead of saying, “I’m sorry to have to tell you this,” the phrase, “I wish things were different” may be equally effective at communicating empathy without conveying responsibility for the condition. (Ref. 10)

**Step 5: Respond to feelings**

Patients and families respond to bad news in a variety of ways. Some respond emotionally with tears, anger, sadness, love, anxiety, relief, or other strong emotions. Others experience denial, blame, guilt, disbelief, fear, or a sense of loss or shame, or may even intellectualize why the situation is happening. A few may demonstrate reflexive psychophysiological responses such as “fight or flight” and may even try to bolt from the room or totally withdraw into themselves.

Outbursts of strong emotion make many oncologists and other physicians uncomfortable. (Ref. 11) Give the patient and family time to react. Be prepared to support them through a broad range of reactions.

Listen quietly and attentively. Acknowledge their emotions. Ask them to describe their feelings:

- “I imagine this is difficult news…”
- “You appear to be angry. Can you tell me what you are feeling?”
- “Does this news frighten you?”
- “Tell me more about how you are feeling about what I just said.”
• “What worries you most?”
• “What does this news mean to you?”
• “I wish the news were different.”
• “I’ll try to help you.”
• “Is there anyone you would like me to call?”
• “I’ll help you tell your son.”
• “Your Mom and Dad are sad now. They’ll feel better when you get better.”

Remind them that their responses are normal. Make a box of facial tissues available. Nonverbal communication may also be very helpful. Consider touching the patient in an appropriate, reassuring manner. Offer a drink of water, a cup of tea, or something else that might be soothing.

Allow time for the patient and family to express all of their immediate feelings. Don’t rush them. Once the emotion is spent, most people will be able to move on. This usually lasts only a few minutes. The most frequent physician error is to talk. (Ref. 12) This is counter-productive. A shared understanding of the news and its meaning enhances the physician-patient relationship and facilitates future decision making and planning.

**Step 6: Plan next steps and follow-up**

Establish a plan for the next steps. This may include gathering additional information or performing further tests. Treat current symptoms. It may include helping parents tell their child about the illness and what treatment will be like. Arrange for appropriate referrals. Explain plans for additional treatment. Discuss potential sources of emotional and practical support (e.g., family, significant others, friends, social worker, spiritual counselor, peer support group, professional therapist, hospice, home health agency, etc.).

Reassure the patient and family that they are not being abandoned and that the physician will be actively engaged in an ongoing plan to help. Indicate how the patient and family can reach the physician to answer additional questions. Establish a time for a follow-up appointment.

Ensure that the patient will be safe when he or she leaves. Is the patient able to drive home alone? Is the patient distraught, feeling desperate, or suicidal? Is there someone at home to provide support?

At future visits, elements of this protocol may need to be revisited. Many patients and families require repetition of the news to gain a complete understanding of their situation.
When Language Is a Barrier

This same six-step protocol for communicating information effectively can be used when the patient and physician do not speak the same language. The assistance of an experienced translator who understands medical terminology and is comfortable translating bad news is required. There are several services in North America that offer translation by telephone if there is no one directly available. Brief translators before the interview and reassure them that their role is only to translate. Verify that they will be comfortable translating the news you are about to give.

If possible, avoid using family members as primary translators. It confuses their roles in the family unit and may raise issues of confidentiality. Additionally, family members may not know how to translate the medical concepts the oncologist is trying to convey, and/or they may modify the news to protect the patient. Instead, when family members are present who do speak both languages, ask them to supplement the primary translation and support the patient and other members of the family.

When working with a translator, sit in a triangular arrangement so that you can face and speak directly to the patient, yet still turn to look at the translator. Speak in short segments, then give the translator time to convey the information. Verify the patient’s and family's understanding and check for an emotional response.

Summary

This six-step protocol for delivering information offers guidelines and practical suggestions on communicating medical information effectively and compassionately, and responding to a patient’s and family’s feelings and needs. Approaches for handling the family who says “don’t tell” the patient, using a translator, and communicating prognosis are also discussed. Tips are provided on communicating when language is a barrier.

The protocol is a framework for approaching this essential task for physicians and all other members of the interdisciplinary team. It is not meant to be a rigid set of rules that must be followed in all cases. Once you have learned the basic steps, learn to customize the protocol to your day-to-day practice patterns (i.e., just as you learned to drive a car, etc.).

When provided effectively, clear communication can only strengthen the physician-patient relationship.
Key Take-Home Points

1. The vast majority of Americans (>90%) want to know about it if they have a life-threatening illness.
2. Use the six-step approach, particularly when learning this skill.

Step 1: Getting started
3. Create an environment that is conducive to effective communication.
4. Ensure that the right people are present.

Step 2: Finding out what the patient knows
5. Start by establishing what the patient and family know about the patient’s health.

Step 3: Finding out how much the patient wants to know
6. People handle information differently.
7. Each person has the right to voluntarily decline to receive any information and may designate someone else to communicate on his or her behalf. Find out how the patient would like to receive information.
8. Rather than confronting family members’ request not to tell with “I have to tell the patient,” explore why they do not want you to tell the patient. Suggest going to the bedside together to find out what the patient wants to know.

Step 4: Sharing the information
9. Deliver the information in a sensitive but straightforward manner.

Step 5: Responding to patient and family feelings
10. Outbursts of strong emotion are an expected component of information sharing. Learn how to cope with this.

Step 6: Planning, follow-up
11. Establish a plan for next steps.

When language is a barrier
12. Verify that translators will be comfortable and sufficiently skilled in translating the news you are about to give.
13. Avoid using family members as primary translators. It confuses their role, frequently compromises the therapeutic quality of the interview, and may compromise some patients’ desire for confidentiality.
Pearls

1. Jargon confuses the message; check for patient/family understanding.
2. The six-step protocol for communicating effectively provides tools for communicating in difficult situations, for families that say “don’t tell,” for defining treatment goals, etc.
3. Don’t use jargon. Patients don’t always understand that lesion, tumor, growth, nodule, and cancer may all be the same thing. Use the “C” (cancer) word. Be clear.
4. If you are feeling overwhelmed by the patient’s and family’s emotional response, name that emotion. “I can see that you are feeling overwhelmed.” Whatever you are feeling is usually a reflection of the patient’s emotions.
5. Make a partnership with your patient and the family caregiver; draw them into the interdisciplinary team and foster their active participation in the care plan.

Pitfalls

1. Failing to recognize that if a patient/family conversation is making you feel anxious the family and patient are likely feeling anxious.
2. Giving exact predictions of survival. Instead of saying, “Your survival is 6 months,” try, “Your survival is months; how you do over the next month or so will help us better determine what to expect.”
3. Talking too much rather than listening.
4. Jumping into a discussion of the treatment of advanced cancer only to discover that the patient doesn’t know the diagnosis. Ask the patient what he or she knows about the illness first.
5. Trying to “soften the blow” by being falsely hopeful. This is vague and misleading. Be kind, but truthful.

Module 7: Communicating Effectively

   The article provides an assessment of Jordanian knowledge and attitudes about cancer; 81.5% of participants wanted to know their diagnosis if they had cancer.

   This article describes a program for teaching medical students how to break bad news. An evaluation of the program by the participants over a 5-year period is presented.

   A protocol for disclosing unfavorable information—"breaking bad news"—to cancer patients about their illness is described.

Talking to Cancer Patients and their Relatives is aimed at trainees in general practice, but is equally appropriate for doctors training in any of the specialties. It presents practical approaches to address the most difficult aspects of communicating with patients with cancer.

The narrative from a real patient encounter is used to illustrate the powerful effect that delivering bad news can have on both patient and physician. The meaning of bad news to the patient compared with the physician are explored.

This is a report of a survey of terminally ill patients regarding the communication skills of their doctors.

A discussion is provided of potential problems that may arise when the physician says, “I'm sorry.”

The authors suggest ways to solve the problem of inconvenience faced by physicians while communicating with patients.

This is a non experimental, descriptive study of audio taped discussions in outpatient primary care practices in the United States.
Self-Assessment

Module 7: Communicating Effectively

1. Mr. Petty is a 58-year-old fast-food worker who had unresectable rectal cancer. The cancer initially disappeared from CT scans after combination chemotherapy and radiotherapy. He has always indicated he has faith in God and the doctor, and has never demonstrated much interest in the details of therapy. Yet, he has always made decisions by himself. At the present office visit, he complains of abdominal discomfort and poor appetite; physical examination shows a large nodular liver. After establishing an appropriate setting, you would next:

☐ a). tell him cancer has spread to the liver
☐ b). tell him he’s in God’s hands now
☐ c). determine what he understands
☐ d). determine who he relies on for support

2. Mrs. Twardowsky is a 62-year-old former cleaning woman with Rai Stage IV chronic lymphocytic leukemia, poorly controlled diabetes mellitus and consequent peripheral neuropathy, renal insufficiency, and coronary artery disease. She has advanced congestive heart failure that is not responding well to medical therapy. Her daughter asks you not to talk to her about the cancer because it “would take away all hope.” She wants you to give chemotherapy, but tell the patient it is “strong antibiotics.” Your best next response is to:

☐ a). ask the daughter more about what kind of hope she would like her mother to have
☐ b). agree and wait for a future opportune time
☐ c). disagree and tell the patient the truth
☐ d). tell the daughter you have to tell the patient the truth
3. Mr. Oliver is a 53-year-old farmer with non small-cell lung cancer metastatic to liver and bone. In talking about the future course of his illness, he begins to cry. His wife is also tearful. Besides having facial tissues available, the next best approach is to:

- a). continue with the discussion
- b). reassure him
- c). be silent
- d). tell them to stop crying

4. You are completing a family meeting for a patient with moderately advanced Alzheimer’s-type dementia and newly diagnosed unresectable pancreas cancer in which you have been describing the nature and likely course of the disease. The patient is unable to participate. In concluding the meeting, it is most important to:

- a). summarize the plan of care
- b). reassure the family that all will be well
- c). tell them to be strong
- d). summarize their decisions about code status
Self-Assessment Answers

Question 1. The correct answer is: c)

This question is aimed at understanding the steps of information giving. It is best to ascertain the patient’s understanding of his situation as well as how much information he wants to know before giving the new medical information. Euphemisms, even well intended, won’t build a therapeutic relationship for the future. They may be interpreted as abandonment. Finding out his support system is important, but not the best answer to the question.

Question 2. The correct answer is: a)

This question is aimed at the physician’s response when the family says “don’t tell.” The best next step is to assess why the family member is making the request. Confronting the family by insisting you will tell or going around them will only create mistrust and likely endanger the therapeutic relationship. Not telling is also inappropriate without ascertaining that is the patient’s desire. After talking with the family member, the next aim may be to have a family meeting to ask the patient how she wants medical information handled.

Question 3. The correct answer is: c)

This question is aimed at the physician’s response to strong emotion. Silence usually is best at first. Telling them to stop crying directly or providing premature reassurance gives them the same message—that you are not acknowledging or interested in supporting them through their emotional response to the news. Continuing with the discussion in spite of tears can also give the same unfortunate message.

Question 4. The correct answer is: a)

This question is aimed at understanding how to finish the interview. It is best to conclude with a summary of the plan for the next steps. Reassurance that “all will be well” may not, in fact, be true. Avoid unintentional messages to not complain. Although a decision about code status may be part of the plan, it should generally not be a single focus of care and should only be summarized in the context of the total plan of care, including what will be done.
